

**Promoting nursing competence in municipal health care services: An interview of experienced nurses' perceptions**

Journal:	<i>Nordic Journal of Nursing Research</i>
Manuscript ID	Draft
Manuscript Type:	Original Article
Keywords:	nursing competence, experienced nurses, municipal health care, workplace environment
Abstract:	The purpose of this study was to explore factors in the municipal workplace environment that can facilitate experienced nurses in promoting their professional competence. This is of particular importance when critically ill patients are discharged from hospital. We interviewed nine nurses who had more than five years' experience in the Norwegian municipal healthcare services and analysed data by qualitative content analysis. We found that the informants have to cope with situations for which they have not been adequately prepared. Two factors in their workplace environment influenced the promotion of their professional competence in such situations: access to knowledge and information, and supportive colleagues. Experienced nurses are an important resource for information and support. However, the findings also suggest that nurses at all levels of competence are dependent on working environments that promote a high standard of nursing.

## Promoting nursing competence in municipal health care services:

### An interview study of experienced nurses' perceptions

#### Abstract

The purpose of this study was to explore factors in the municipal workplace environment that can facilitate experienced nurses in promoting their professional competence. This is of particular importance when critically ill patients are discharged from hospital. We interviewed nine nurses who had more than five years' experience in the Norwegian municipal healthcare services and analysed data by qualitative content analysis. We found that the informants have to cope with situations for which they have not been adequately prepared. Two factors in their workplace environment influenced the promotion of their professional competence in such situations: access to knowledge and information, and supportive colleagues. Experienced nurses are an important resource for information and support. However, the findings also suggest that nurses at all levels of competence are dependent on working environments that promote a high standard of nursing.

**Keywords:** Nursing competence, experienced nurses, municipal health care, workplace environment

#### Introduction

Nursing environments are constantly changing as a result of the introduction of new technology, economic and political reforms and developments in public health. The move towards primary care as a model of health care and service provision has necessitated changes in nursing environments, roles and responsibilities. In a literature

1

4  
5  
6  
7  
8  
9 review, Barrett and colleagues <sup>1</sup> highlighted the extremely complex role of nurses in  
10 community nursing. Community nurses work with a range of patients and service users  
11 in very diverse settings, which requires a high level of flexibility and diversity of  
12 knowledge and skills. The implementation of the Norwegian Coordination Reform <sup>2</sup>  
13 has necessitated that nurses working in municipal health care services in Norway have  
14 to deal with new and advanced procedures and treatments for patient groups that would  
15 previously have been treated in hospital <sup>2,3</sup>. Most of these nurses have not had the  
16 opportunity to develop their competence in accordance with the increasing demands for  
17 specialised nursing skills <sup>4</sup>. In both nursing homes and home care services, nurses often  
18 work alone or with a limited number of colleagues and with no formal setting to discuss  
19 nursing problems <sup>5-9</sup>. Some Swedish studies have highlighted that nurses feel  
20 undervalued and frustrated when expected to “be everywhere and know everything” <sup>10</sup>  
21 (p.265), as they are expected to provide specialised care without specialist training <sup>11</sup>. In  
22 Norway, well-qualified clinicians are essential to meet patients’ complex care needs <sup>5</sup>.  
23 Nursing education alone is not enough; it has to be seen within the context of nurses’  
24 working conditions and collaboration routines with colleagues and leaders <sup>8</sup>. Work  
25 conditions such as understaffing, time issues and increased pressure on nursing home  
26 staff all contribute to insufficient care <sup>12</sup>. Nurses seem to find different strategies such as  
27 working overtime or dropping breaks to bridge the gap between their professional ideals  
28 and their working reality <sup>13</sup>.

41  
42 The workplace environment can be described as the tone of the workplace,  
43 influenced by different factors, such as access to needed resources, good  
44 communication with team members, knowledgeable and supportive managers, input  
45 into workplace decisions, and a reasonable workload <sup>14-17</sup>. Factors that home care nurses  
46 value as supportive of professional nursing practice are strikingly similar to those  
47 valued by hospital-based nurses <sup>16</sup>.

8  
9 A supportive workplace environment is highlighted in a number of studies  
10 worldwide as an important factor for nurses' satisfaction, retention and continuity of  
11 employment<sup>13, 14, 18, 19</sup>, and for nurses' confidence in decision-making processes<sup>20</sup>.  
12 Several of the studies emphasise the importance of a supportive workplace environment  
13 for the nursing role, but focus less on the specific factors of importance in providing  
14 nursing care in line with the level of competence of the most experienced nurses.  
15  
16  
17  
18  
19 The purpose of this study is to explore experienced community nurses' perceptions of  
20 workplace factors that can influence professional care delivery in line with their  
21 competence.  
22  
23

24  
25 Benner's theory and insight into experienced nurses' competence provides an important  
26 point of reference for this study<sup>21-23</sup>. One of her implications for nursing administration  
27 and practice is that times of increasing cost and efficiency with fewer nurses make it  
28 more necessary than ever to keep and develop the competence of the most proficient  
29 nurses<sup>23</sup>. Experienced nurses can have the necessary skills, commitment and ability to  
30 persevere with their work, which makes them an important resource for their  
31 environment<sup>21, 23</sup>. The involvement of experienced nurses can ensure that a clinical  
32 situation is viewed from various perspectives and reduce the likelihood of hasty  
33 decision making<sup>23</sup>.  
34  
35  
36  
37  
38  
39  
40  
41  
42

43 Nursing competence is context and time specific<sup>24</sup>. Benner<sup>21</sup> describes five categories  
44 of nursing competence: novice, advanced beginner, competent, proficient, and expert  
45 nurse. She claimed that clinical knowledge is gained over time, but that this progression  
46 does not refer to the mere passage of time or longevity. The individual nurse's  
47 background, experience and knowledge will affect the level of skills<sup>22</sup>, and competence  
48 building requires a supportive work environment that promotes sharing knowledge and

9 learning from experience. Nursing is more than a predetermined set of procedures and  
10 techniques; it is a complex socially organised activity under constant development that  
11 requires situational understanding and clinical reasoning acquired and developed over  
12 time<sup>23</sup>.  
13  
14

## 15 16 17 18 Research methods 19

20  
21 To explore nurses' experiences and the challenges they face in their everyday  
22 work, we conducted qualitative interviews with nurses in nursing homes and home care.  
23 The nurses had a minimum of five years' experience in municipal health care. The  
24 convenience sample was recruited in a municipality in Northern Norway (population:  
25 10-30000). To ensure confidentiality the authors will not divulge further the number of  
26 years of experience nor the exact size of the municipality. Written requests were sent to  
27 supervisors; they in turn informed the researchers about possible candidates who  
28 fulfilled the selection criteria. Nine candidates agreed to participate. They were all  
29 female, between the ages of 30 and 50, and all had more than five years of work  
30 experience in municipal health care. Three informants were employed in home care, two  
31 in general nursing homes and four in specialised departments of nursing homes (see  
32 Table 1). In accordance with the informants' wishes, all interviews were conducted  
33 during working hours at their workplaces. At the beginning of each interview,  
34 information about the study was repeated and any questions answered.

60

Based on available literature on nurses' experiences of their workplace environment and nursing competence, a semi-structured interview guide was prepared. In addition to covering the main themes, the participants provided supplementary information. The researchers had also the opportunity to pose follow-up questions and ask for clarifications. The interviews lasted between 50 and 90 minutes and were audio recorded and transcribed verbatim.

*Table 1 Presentation of the participating nurses*

Workplace	Informants (n=9)	Presentation
Home based (HB)	3 nurses	HB1, (>5 years of experience) HB2 (>10 years) HB3 (>15 years)
Nursing home (NH)	2 nurses	NH1 (>5 years) NH2 (>5 years)
Specialised nursing home (SNH)	4 nurses	SNH1 (>10 years) SNH2 (>10 years) SNH3 (>10 years) SNH4 (>5 years)

### Data analysis

A qualitative content analysis, inspired by Graneheim and Lundman<sup>25</sup>, was carried out. The participants' statements were read through several times in order to

Meaning units	Sub-categories	Categories
---------------	----------------	------------

gain an overall impression of each narrative and to grasp the meaning of the whole. The text was then divided into meaning units by selecting words and sentences that conveyed meaning related to the aims of the study. These were further condensed whilst maintaining the core meaning and closeness to the original interview text. The condensed text was then abstracted and sub-categories and categories at a higher level were created (see Table 2). Category 1 “Access to knowledge and information” has two sub-categories “unprepared” and “use of free time”. Category 2 “Supportive collegial relationships” has two sub-categories “Knowing each other” and “Caring for and supporting each other”.

All authors read the transcribed data separately and discussed the subsequent interpretations.

*Table 2. Examples of meaning units, sub-categories and categories emerging from the analysis*

<p>“There’s a lot of technical procedures that comes with the patients, so we’ve just had to deal with it.”  “... but we don’t have staff that are trained for this. But they told us we had to.”  “Suddenly we got an alarm from a patient we didn’t know had been discharged from hospital and that she had cancer and a central venous catheter. Luckily there were two of us on the job, and fortunately the other one had just come from a nursing home, where they have a bit more of that kind of thing than us in home care.”</p>	Unprepared	Access to knowledge and information
<p>“I went to the hospital in my free time before the shift, so they could teach me. Just so that I could feel confident during the procedure.”  “I decided to do extra shifts at the hospital to freshen up my skills (...) I just decided to do it on my own, so that I can feel confident here in a way.”</p>	Use of free time	
<p>“We know each other so well that we dare to tell each other if something comes up.”  “It’s not all your feelings you can share with another person.”  “You know the strengths and weaknesses of your colleagues.”  “You get to know each other a bit and then it’s easier to ask.” A2</p>	Knowing each other	A supportive collegial relationship
<p>“If I notice someone making a mistake, I tell them how to do it.”  “We benefit from each other and distribute the work between the experienced ones and the new ones, we help and support each other.”  “What I do is to work with and supervise those who are weaker professionally.”  “We try to support one another, when we see that there’s a nurse suited to this and she ought to do it.”</p>	Caring for and supporting each other

## 20 21 22 23 Findings

24  
25  
26 The findings reveal that the nurses lacked adequate information and training in order to  
27 meet the challenges they faced in their everyday work. They also spoke about the  
28 importance of having supportive relationships with their colleagues. Supportive  
29 relationships involved the following qualities: confidentiality, attentiveness and the  
30 availability of collegial support in difficult situations.  
31  
32  
33

34  
35 In the following, findings and the content of each category will be described and  
36 examples given to illustrate the nurses' statements.  
37  
38

### 39 *Access to knowledge and information*

40  
41 All the nurses in the study spoke about patients coming from hospital to their workplace  
42 with different treatment regimens to be followed up by the nurses. Several indicated that  
43 they needed access to more information on the patient's condition and further treatment  
44 and care, as well as knowledge of how to use any advanced technology that  
45 accompanied the patient.

### Unprepared

Our informants reported feeling inadequately prepared or completely unprepared for many tasks they are expected to master in their everyday professional practice in both home nursing and in nursing homes. This may involve unfamiliar technological procedures or a lack of information about the patient's return home and the further treatment regimen. In addition, tasks may arise regardless of the nurse's available time and opportunity to prepare, as stated by the following informants:

*Patients may come at weekends (from hospital) at any time of day or night (..) it's awful when they arrive in the evening at shift handover, in the middle of the evening meal and we know little about the patient and we aren't so many as on the day shift (SNH1)*

*...It varies how much information comes with the patient (from hospital). We often find that many of them come without a discharge summary, when it's not ready, so we have to ring and ask and never get it. This is the patient's home, but the discharge summary is sent to the doctor and the patient himself, so we're the odd one out. It may take a week before it comes (..) We wonder what's been done and what we're supposed to look out for. How is the patient better and what medications have changed? Has the prescription been sent? If it's at a weekend, we may not be able to get hold of medicine. (SNH3)*

*Suddenly we got an alarm call from a patient that we didn't know had been discharged from hospital and that she had cancer and a central venous catheter. Luckily there were two of us on the job, and fortunately the other one had just come from a nursing home, where they have a bit more of that kind of thing than us in home care. (HB1)*

The nurses seemed to be faced with rather random and often sudden tasks and situations. It varied whether they had sufficient information and knowledge. They stated that they just have to put up with the way things have become, because even if they make it clear that they are not prepared, the work still has to be done.

*We see more severely ill people and have bigger challenges and, of course, we also notice that they're being discharged much earlier and there's a lot of technical procedures that come with the patients, so we've just had to deal with it. (SNH4)*

*It's also happened that we've been given patients where they [the hospital] have assumed that we should offer intravenous treatment and Pari inhalations [nebulisers], but we don't have staff that are trained for this. But they told us we had to. (NHI)*

1  
2  
3  
4  
5  
6  
7  
8  
9 The nurses were asked to perform procedures whether they were trained for them or not,  
10 and they had to respond as best they could by finding acceptable solutions, alone or in  
11 collaboration with a colleague who could also be unfamiliar with the procedure. Not all  
12 nurses felt confident in their actions, as NH1 said:  
13  
14  
15  
16

17 *We changed the venous cannula. Of course we did, but not all of us have enough*  
18 *confidence to do it. I don't feel like an expert either, but we hung up the infusion*  
19 *and it worked. (NH1). (...) We have the equipment, but we need someone to*  
20 *teach us, so the patients and the relatives can feel safe. (NH1)*  
21  
22  
23  
24  
25  
26  
27  
28

### 29 *Use of free time*

30

31 Our informants expressed a need to feel confident in their nursing practice,  
32 which entailed having adequate knowledge and information. Their statements suggest  
33 that they felt a sense of responsibility for safeguarding patient care.  
34  
35  
36  
37

38 *We usually demand that they [the hospital] teach us. We can't just accept it, can*  
39 *we, if suddenly the patient's there? At least for my own sake, I need to feel safe*  
40 *when he comes [home]. (SNH4)*  
41  
42  
43  
44

45 *We can't take over a patient if we don't know what to do. We just have to learn*  
46 *the different things, like various types of aids (..) Then you have to go to the*  
47 *hospital and get training before the patient arrives. (HB2)*  
48

59  
60

1  
2  
3  
4  
5  
6  
7  
8  
9 Before meeting the patients and with their best interests in mind, they searched for  
10 information or actively taught themselves before carrying out the nursing procedures  
11 they were required to perform. The nurses worked overtime in order to learn from their  
12 colleagues, took courses during off-duty hours, or even did extra work in the hospital.  
13  
14  
15  
16  
17 The nurses in the study felt that their line managers often failed to recognise their needs.  
18

19  
20 *One of us worked overtime and the other one arrived early so that we could*  
21 *carry out the procedure with the central venous catheter together. So that's how*  
22 *things work. (SNH4)*  
23

24  
25  
26  
27 *It's happened that I've rung a nurse on the other side (other department) and*  
28 *asked her in her spare time, "What do we do here?". So it happens that you get*  
29 *a call when you're off when you know the patient better than the others (SNH2)*  
30

31  
32  
33  
34 *I was on the weekend shift and the patient was due to come home on the Friday.*  
35  
36 *So then I went to the hospital in my free time before the shift so that they could*  
37 *teach me. Just so that I could feel confident during the procedure. (SNH4)*  
38

39  
40  
41  
42 *I decided to do extra shifts at the hospital to freshen up my skills. They don't*  
43 *always see what we need, the people in management. I just decided to do it on*  
44 *my own, so that I can feel confident here in a way. (NH1)*  
45  
46  
47  
48  
49  
50  
51  
52  
53  
54

58  
59  
60

1  
2  
3  
4  
5  
6  
7  
8  
9 Mostly, the nurses (HB3, NH1, SNH4) had to go outside their own workplace to access  
10 the necessary knowledge, not only from the hospital but also from other sources. As one  
11 of them said:  
12  
13

14  
15  
16 *We try to get information from the police about drugs “what’s going around”*  
17 *and “how does it work”. New drugs are constantly appearing and we learn*  
18 *about them through the media, the Internet and newspapers (HB3)*  
19  
20  
21  
22  
23  
24  
25  
26  
27  
28

### 29 *Supportive collegial relationships*

30  
31 The informants’ statements indicate that nurses worked actively to improve both  
32 their own and their colleagues’ level of competence. They supported each other in their  
33 efforts to provide safe professional treatment for the patients. When they distributed  
34 tasks, they tried to take into consideration their colleagues’ skills and expertise and  
35 compare them with the individual patient’s condition, and to consider whether a  
36 particular care provider is capable of carrying out a specific task. In order to do this,  
37 they needed to know each other well, both professionally and as individuals.  
38  
39  
40  
41  
42  
43  
44  
45  
46

### 47 *Knowing each other*

48  
49 Knowing each other well lowered the threshold and made it easier to discuss  
50 uncertainties of a professional or ethical nature. As NH2 said:

*We know each other so well that we dare to tell each other if something comes up, and we can call each other privately. It's perfectly all right to call each other and say, I wonder, you know in that room, what was the outcome? It's so nice that we're such a tightly knit group. It's perfectly acceptable to call each other and when you finish the day shift say: "If anything's unclear, just call me".*

(NH2)

Another nurse (SNH1) said:

*Sometimes the air needs to be cleared and you can't always discuss these things with everybody: there are some feelings you can't share with just anyone.*

(SNH1)

Knowing nurses from other departments was also important (SNH1, HB1). As SNH1 said: *"It's much easier when we know who they are and can put a face to a name."*

### *Caring for and supporting each other*

The nurses were conscious of the importance of peer support and of asking each other how they were managing and relieving each other if necessary. As SNH 1 said: *"We always find someone to talk to (...) And then we help each other and try to share the workload. Experienced nurses as well as novices help and support one another".*

1  
2  
3  
4  
5  
6  
7  
8  
9 With a caring and humble approach, they engaged in their colleagues' tasks, pointed out  
10 possible mistakes and offered guidance. As NH1 said:

11  
12 *If I notice someone making a mistake, I tell them how to do it. I've done this, and*  
13 *made mistakes myself, so it has nothing to do with being perfect, so feel free to*  
14 *let me know as well.*

## Discussion

Our findings, like those of Benner<sup>22</sup>, show that long experience in itself is insufficient to practice nursing at the highest levels (proficient or expert). For example, the patients and nursing tasks transferred from hospitals to local health services may be unknown and unfamiliar for our informants, who have little or no experience with advanced medical treatment. In this way, their familiarity with everyday work is affected in that the “flow” of their work can easily be disturbed or undermined. According to Benner<sup>23</sup>, unforeseen tasks and changes in a patient’s condition will require experiential knowledge for the nurse to be able to detect qualitative differences and make the necessary professional judgements. This knowledge appears to be insufficient when our informants lack training in the use of technological equipment or information about a patient’s treatment regimen after discharge from hospital. Limited information on patient treatment after discharge seems to be a familiar phenomenon in many parts of Norway<sup>26-28</sup>. The nurses in our study reported that they themselves had to seek the information they needed in patient care as this did not always accompany the patient. This seems to be unfortunate in several respects. Firstly, information flow outside an electronic patient record system will increase the risk of leaking sensitive patient information and thus violate confidentiality<sup>26</sup>. It can be conducive to malpractice if

1  
2  
3  
4  
5  
6  
7  
8  
9 nurses rely solely on information received from patients and caregivers, as these facts  
10 could be wrong or misunderstood <sup>29</sup>.

11  
12  
13 The nurses in this study reported feelings of discomfort when they were not adequately  
14 prepared to meet the needs of their patients. This is in line with Flöjt and colleagues <sup>30</sup>,  
15 who show that community nurses need both theoretical and practical preparation in  
16 order to feel that they master their role. Nurses' access to important information and  
17 specialised training to carry out advanced procedures will influence patient safety and  
18 the quality of care. It is suggested that there is an association between readmissions to  
19 hospital due to discharges before proper municipal nursing care systems are in place <sup>31</sup>.

20  
21  
22 The findings in our study can indicate a lack of systems, which could have had serious  
23 consequences for the patients, had the nurses not taken responsibility and retrieved the  
24 necessary information or acquired the necessary competence. The nurses in the study  
25 described being inadequately equipped to deal with these situations. We can only  
26 speculate how less experienced nurses would cope. According to Benner <sup>22, 23</sup>, less  
27 experienced nurses are dependent on more experienced colleagues. Experienced nurses  
28 who lack expertise in certain situations will often know how to access both information  
29 and support.

30  
31  
32 According to Kihlgren et al. <sup>20</sup>, experienced nurses in municipal health care are  
33 presumed to be able to make the right decisions when a patient suffers acute illness or  
34

8  
9 needs hospitalisation. Kihlgren et al.<sup>20</sup> claim that in order to have faith in their  
10 competence and professional role, nurses need sufficient knowledge about patients and  
11 a supportive environment. This can be a major challenge to nurses working in municipal  
12 healthcare, where they are influenced by organisations that create a power imbalance<sup>28</sup>,  
13 discrepancies in competence<sup>8</sup> and increased pressure<sup>32</sup>. Our findings show that the  
14 nurses felt pressurised to carry out procedures for which they lack competence, despite  
15 having reported this to their supervisors. This can indicate a lack of support from a  
16 managerial level.  
17  
18  
19  
20  
21  
22  
23  
24  
25  
26

27 Managerial and systemic support can influence work satisfaction and the will to  
28 continue working<sup>14,16</sup>. The nurses in this study spoke of lacking competence in using  
29 advanced technological equipment, which is in line with similar studies<sup>5</sup>. Increased  
30 time off for training may be a necessary factor to avoid an unfortunate refocusing of  
31 work priorities. For example, a Swiss study<sup>19</sup> showed that limited time for nursing  
32 practice implicitly affected nurses' prioritisation of work tasks, such as a lower focus on  
33 the social aspects of patient care.  
34  
35  
36  
37  
38  
39  
40  
41  
42

43 In our study, we find that experienced nurses wish to act according to their professional  
44 standards and take on the responsibility of finding the correct solutions, in line with  
45 Benner<sup>23</sup>. In their everyday practice, they attempt to find and share knowledge with  
46 colleagues, which is a traditional way to acquire knowledge and solve problems<sup>6,9</sup>. A  
47 necessary precondition is that colleagues are accessible and have the relevant  
48  
49  
50  
51  
52  
53  
54  
55

3  
4  
5  
6  
7  
8  
9 knowledge. The question remains as to whether this is a possible solution for  
10  
11 community nurses. From other surveys, we know that in home based services nurses  
12  
13 often work alone<sup>33</sup> and see themselves as lonely fixers<sup>10</sup> (p.265), working with  
14  
15 colleagues with limited qualifications<sup>8,10</sup>. The findings in this study reveal that relying  
16  
17 on colleagues is not always enough to ensure safe practice. Nurses' colleagues could  
18  
19 also have insufficient knowledge, so nurses would have to seek information and  
20  
21 necessary training outside their workplace, e.g. by taking on extra work in the hospital  
22  
23 or taking courses in their spare time. According to Debesay et al.<sup>34</sup>, it is the  
24  
25 responsibility of the public authorities to provide adequate learning facilities. The  
26  
27 nurses in the present study seem to take responsibility themselves in order to  
28  
29 compensate for inadequate systems. Doing a lot of voluntary extra work without  
30  
31 getting paid may over time be exhausting for nurses, or according to Tourangeau<sup>18</sup>,  
32  
33 make nurses less inclined to continue their career as nurses. When nurses in home care  
34  
35 try to live up to the profession's high ethical standards by working overtime and cutting  
36  
37 down on breaks, sick leave or working part-time may be a solution to reduce the  
38  
39 physical and moral stress of working in such a demanding environment<sup>13</sup>.  
40  
41  
42  
43

44  
45 According to Bedin et al.<sup>35</sup>, nurses are the linchpin that binds functionality and  
46  
47 community in nursing homes. A hallmark of nursing as a profession is that it is a  
48  
49 coherent, socially organised activity<sup>22,36</sup>. But it requires a supportive work environment  
50  
51 that promotes sharing knowledge and learning from experience when to develop nursing  
52  
53  
54  
55  
56

4  
5  
6  
7  
8 skills<sup>23</sup>. Collegial support seems to be determined by nurses' mutual trust and  
9 solidarity. Our findings suggest that the greater the trust and familiarity between staff,  
10 the easier it is to make contact and discuss professional or personal matters. Through the  
11 care they show for each other, they make themselves available to their colleagues in  
12 their spare time, answer questions, give advice and listen to their emotional troubles.  
13 This can be interpreted as a way of including each other in a secure and trustful working  
14 community that makes them unafraid to ask questions. According to Benner<sup>23</sup>,  
15 inclusion is particularly important for less experienced nurses, as they are particularly  
16 vulnerable to the stress they face when their duties exceed their competence. These  
17 nurses need most of all psychological support and space to discuss the various everyday  
18 issues they face, according to Benner. Our findings indicate that this is also important  
19 for nurses with considerable experience. Even though our informants have many years  
20 of experience at their workplace, the responsibility they face may nevertheless be too  
21 much for their experience and knowledge. Psychological support and opportunities for  
22 discussion therefore seem to be necessary for all nurses, regardless of their level of  
23 expertise. This can be compared to work environment traits, which Flynn<sup>16</sup> calls  
24 processes; these are interpersonal activities or interventions related to care delivery. In  
25 her study, she found that home care nurses rate the presence of supportive supervisory  
26 staff as the one agency trait they considered most important to them and their practice.  
27 Carlson and colleagues<sup>37</sup> find in their study that home care nurses need to be able to

8  
9 balance independence with the loneliness that the job entails, which requires many years  
10 of experience in addition to cooperation. The authors go so far as to say that the  
11 relationship between staff is just as important as the relationship built with patients, as a  
12 respectful collegial relationship has a positive influence on work satisfaction and the  
13 desire to stay in the job.  
14  
15  
16  
17  
18

19  
20 Our findings suggest that good collegial solidarity enables experienced nurses to  
21 strengthen and maintain both their own individual expertise and collegial expertise. The  
22 informants stated that they supervise closely and even intervene with their knowledge to  
23 ensure that work is done correctly. At the same time, they show each other care and  
24 respect, revealing their own shortcomings and fallibility. In this way, they seem to  
25 create a positive climate of confidence and possibilities rather than helplessness in the  
26 face of any serious and critical situations that may arise. This seems to be in line with  
27 Benner<sup>23</sup>, when she points out the importance of developing collaborative and  
28 affirmative teamwork with clear communication channels that communicate and  
29 develop the cumulative knowledge acquired. To make this possible, it seems necessary  
30 to provide nurses with suitable facilities to support them. Such facilities are mentioned  
31 by Rosness<sup>38</sup>, who writes about organisations which aim to ensure that work is  
32 performed as intended. He argues that this requires the availability of experienced  
33 employers and an opportunity to observe, to listen to justifications and also to overlap in  
34 knowledge and task management. This type of culture in a workplace and the

16  
17

### 18 Limitations

19  
20 The scope of the study is small but the nurses' rich descriptions of working alone and  
21 dealing with complex cases will have relevance in other similar settings around the  
22 world. The study was carried out in 2012 but has continued relevance as the working  
23 environment for these community nurses has not changed. The authors see the necessity  
24 of further action research studies involving community nurses.

### 35 Concluding comments

36  
37 Our study reveals how experienced nurses can contribute to the promotion of  
38 safe nursing practices for patients in municipal health care, as long as the culture in the  
39 workplace is facilitated to comply with this purpose. It is important to have time, to  
40 provide relevant information and to have an overview of collegial skills to enable nurses  
41 to have access to the knowledge they require and share knowledge when necessary. It  
42 also seems evident that nurses must have the opportunity to maintain and develop their  
43 cooperation with colleagues so that the professional quality of care becomes a shared

8  
9 responsibility. The contribution from management is essential, in being attentive to  
10 employees' expressed concerns and by creating working conditions that satisfy the  
11 professional judgement of experienced nurses. If nurses are expected to adapt to a new  
12 work situation, they are dependent on an attentive management that listens and supports  
13  
14  
15  
16  
17  
18<sup>39</sup>. Even though this managerial dimension is beyond the scope of this study, it is an  
19 interesting theme for further research.  
20  
21

22  
23 This study emphasises that experienced nurses and their dedication to safe  
24 practice can significantly contribute to establishing a more systematic approach to  
25 training and information access. This approach is important to the experienced nurses,  
26  
27  
28 but much more so for inexperienced nurses who depend on their expert colleagues to  
29 develop their clinical skills. We encourage further studies on how novice nurses handle  
30  
31  
32 situations with new work tasks that challenge their existing skills.
